Pre-operational inspection

Complete reports. Less follow-up

Pramana guides field operators to collect complete evidence, so supervisors can focus on review and action.

Field report → Evidence → Work Order

Field operator on phone · Supervisor on laptop

p2h.apta.works ↗

Field operators report. Supervisors chase the gaps.

Incomplete reports create more work for supervisors

> “Truck checked. All good.”

Illustrative operator message.
No component details. No supporting photos.

01 **Observations arrive without structure.**

The supervisor has to reconstruct what the operator inspected and found.

02 **Required information or evidence is missing.**

A result alone does not show the component’s condition or the basis for the report.

03 **Review turns into repeated follow-up.**

Missing details mean more questions before the supervisor can decide what to do.

Illustrative operator message. Missing details and photos leave more questions for the supervisor.

Guided reporting, with follow-up built in

Lumo turns field input into reports and Work Orders

Field operator

Report the vehicle's condition.

Use a guided conversation to provide observations and photos.

Lumo

Resolve the missing information.

Ask for details or clearer photos against the Inspection Plan.

Inspection Report

Structure results with their evidence.

Keep vehicle, component, observation, and evidence together for review.

Generated Work Order

Turn a finding into a task.

For a flat tyre, generate a Work Order to purchase a replacement tyre.

Supervisors monitor both reports and Work Orders.
Lumo helps prepare the information and the next action.

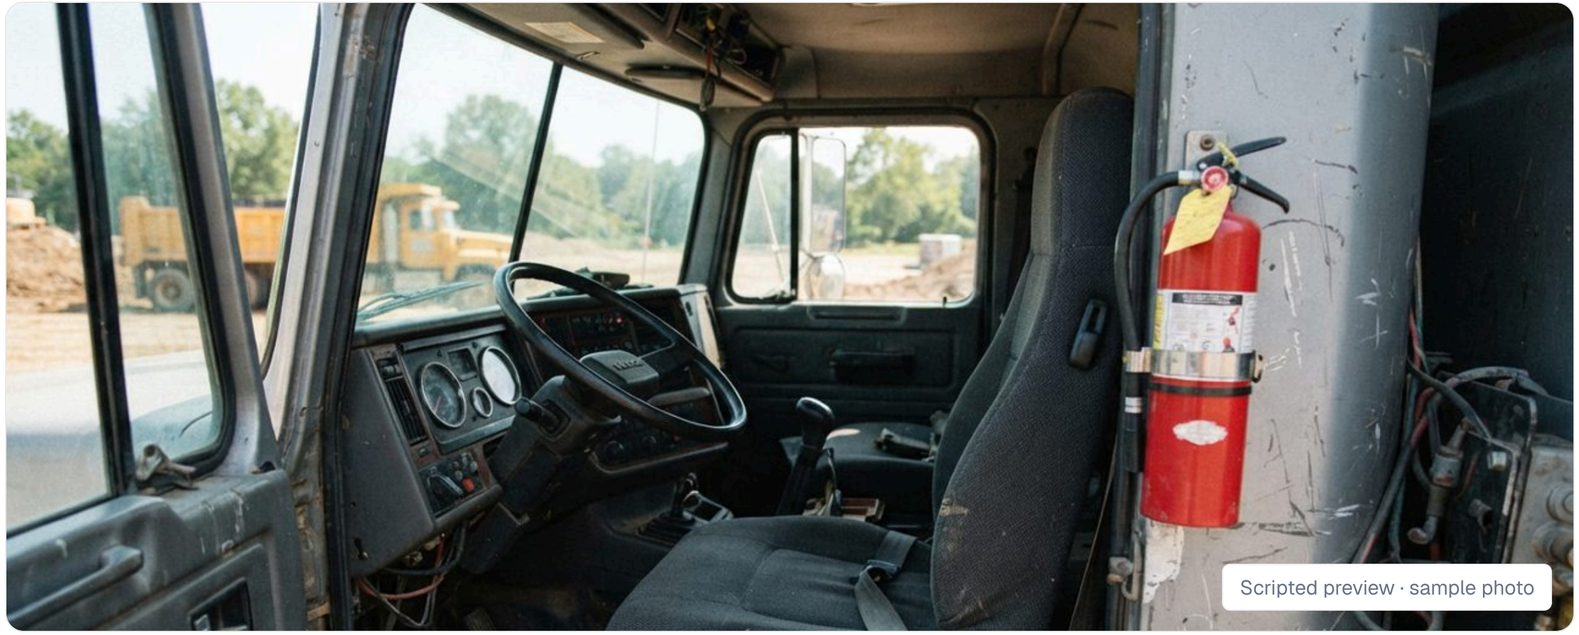

One connected workflow

Reports and Work Orders stay linked to the vehicle, component, and evidence.

90-second demo · one vehicle, one reporting story

A complete report for review

1 · Field input | 2 · Missing detail resolved | 3 · Supervisor report

Lumo
Guided evidence collection

Required detail missing

The photo needs more detail.

The extinguisher is visible, but its label is unreadable. Lumo asks the operator for a closer photo.

Required evidence is requested while the operator is still at the vehicle.

Open field operator app ↗ | Open supervisor reports ↗

Operator input, evidence, and report in one flow.

Scripted slide preview with sample photos and a prepared supervisor report capture.

Deep Domain AI · AI-Native Products & Operations

Inspection context connects evidence to action

Vehicle context

Questions fit the component.

The Spec Sheet and Inspection Standard define what needs checking and which evidence to request.

Evidence context

Gaps trigger specific follow-up.

Lumo asks for missing information or clearer photos. Code enforces required results and evidence.

Action context

Findings generate Work Orders.

Example: a reported flat tyre produces a task to purchase a replacement, linked to the finding.

The supervisor keeps the context across the report, its evidence, and the Work Order.

Vehicle-specific questions, required evidence, and Work Orders share the same inspection context.

The intended operational value

Less chasing.
More time for review and follow-up

Field operator

Gets guidance on the details and evidence needed before submitting a report.

Supervisor

Receives structured reports and monitors findings with their evidence.

Follow-up team

Receives generated Work Orders linked to the reported issue.

Pilot measurement plan

Report completeness

Required information and evidence present at submission.

Supervisor effort

Review time and clarification requests per report.

Follow-up visibility

Time from finding to Work Order and its handling status.

Compare the current reporting process with Pramana on the same inspection scope. Time savings remain to be measured.

Use of Codex

Domain context.
Verifiable work for Codex

Codex · work instructions from the repo

```
Read the PRD and domain context.
Work through the scoped tickets.
Keep required-evidence rules in code.
Run type checks, build, and UI checks.
Review the change against its criteria.
```

Core tickets ↗ | Definition of Done ↗ | Design system ↗

Explicit domain context

Roles, inspection requirements, evidence, and Work Orders have explicit definitions.

Tasks with clear outcomes

Example from the repo: block report submission while required item results are missing.

Checks against the requirements

Check missing-input cases, report completion, and the UI against the ticket criteria.

Repo artifacts: domain context, tickets, and verification criteria.

Workflow sources: repository tickets, data contracts, and the design system.

Pre-operational inspection

Every report, ready for the next action

Complete evidence for review.
Generated Work Orders for follow-up.

A complete report records the required information, evidence, and inspection exceptions. The supervisor retains the operational decision.

Architecture references: ADRs 0004–0007 and prior source review. Current workflow wording includes the team's clarification.

Q&A · What the supporting materials establish

Evidence and validation boundaries

Captured pages use prepared records.

Plans and a report are visible in capture.json ↗. The capture process did not run a complete inspection or create a Work Order.

The slide preview is scripted.

Demo buttons switch between sample photos and a report capture. The application links open the separate live demo.

Completeness supports supervisor review.

Required results and evidence need to be present. Inspection exceptions need an explanation. This does not guarantee vehicle safety or photo authenticity.

Work Orders record follow-up tasks.

A flat tyre can generate a task to purchase a replacement. Generating the task does not execute the purchase. Supervisors monitor its status.

Supervisor time savings need measurement.

Pilot measures: review time, clarification requests, report completeness, and time from finding to Work Order. No impact numbers are claimed.

Design references and task artifacts differ.

Supplied UI screens show intended behavior. Repo tickets show the Codex workflow. Original session logs are needed for specific execution attribution.

Sources: PRD, team clarification, prior evidence review, and original app captures. Presentation checks are separate from app tests.

Q&A · Arguments and evidence

Six criteria. One product story

Criterion	Argument / evidence shown	Pitch segment
Problem & Solution Fit	Incomplete operator reports create supervisor follow-up. Guided reporting addresses the missing information.	02 Problem · 03 Solution
Build Quality	App demonstration, structured records, required-evidence rules, and report visibility.	04 Demo · 05 Approach
Insight & Originality	Vehicle and component context guides evidence collection and follows the finding into its Work Order.	03 Solution · 05 Approach
Real-World Value	Operator guidance, less supervisor follow-up, and monitoring of reports and Work Orders. Pilot measures defined.	06 Value · 08 Next step
Alignment with Build Direction	Deep Domain AI and AI-Native Products & Operations applied to pre-operational inspection.	05 Approach
Use of Codex	Domain documents, scoped tickets, contracts, and verification criteria. Session attribution remains separate.	07 Codex

Criteria follow the supplied judging rubric. No scoring weights are assumed.
