Inspections, surveys, and reporting

What if inspections, surveys, and reporting were supported by a proactive AI agent?

An agent that prepares the right checks, asks for missing evidence, and keeps findings connected through follow-up.

Scattered context and incomplete evidence

The problem

Collecting and assembling the report

Checklists, photos, chat messages, and spreadsheets scatter the inspection context. Reports are assembled manually, with details and evidence still missing.

Reviewing and acting on findings

Supervisors ask again to understand the finding. Missing photos mean extra trips, recurring issues are easy to overlook, and follow-up needs an owner and next step.

Illustrative conversation

Field operator

Checked the truck. Tyre looks bad.

Supervisor

Which truck and tyre? What did you find?

Field operator

DT-07, rear left. Probably needs replacing.

Supervisor

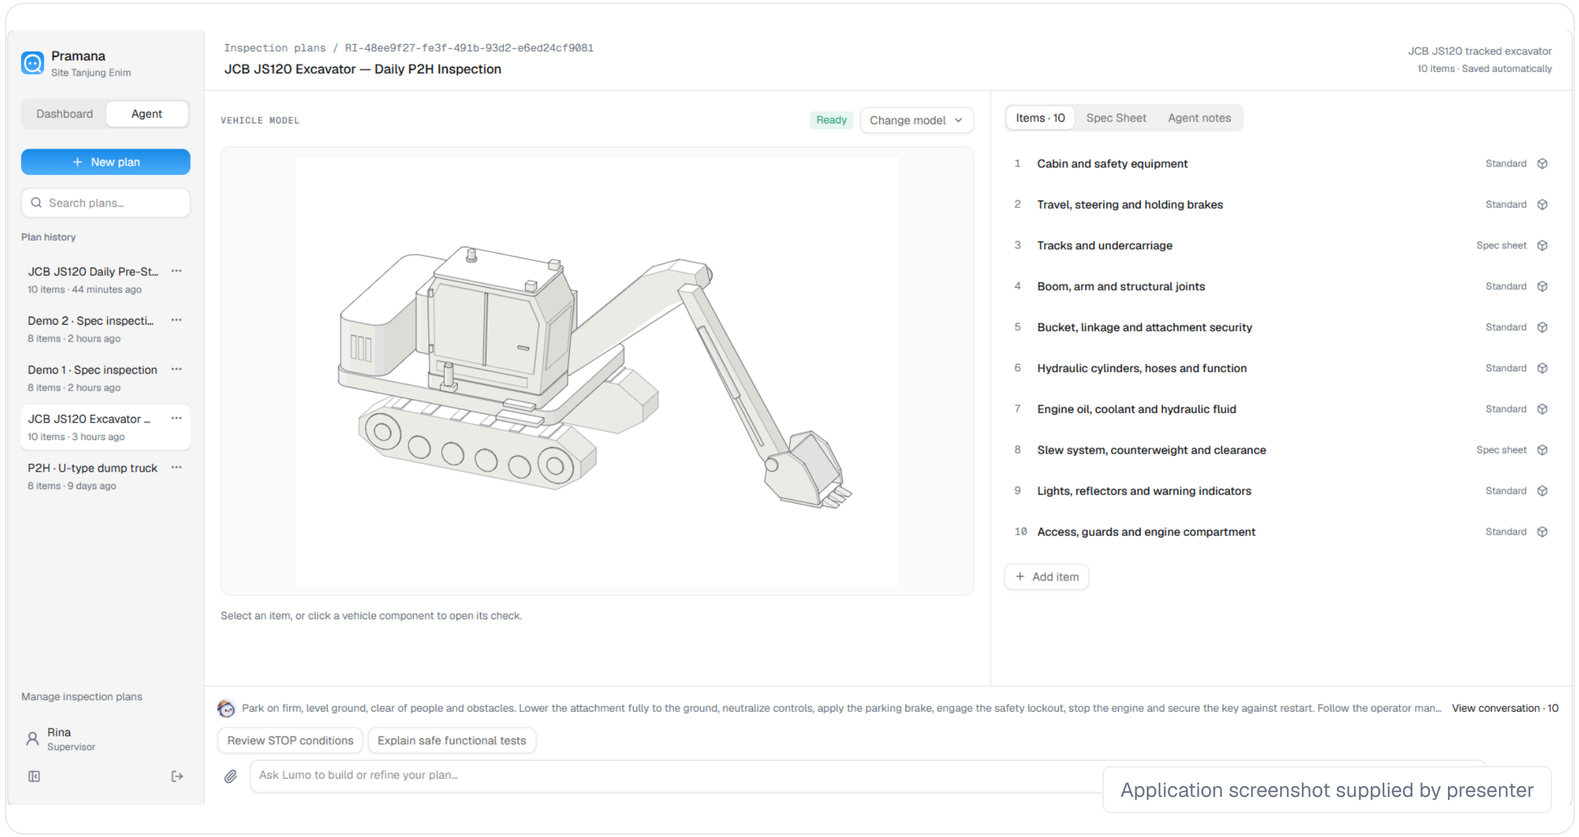

Is it flat or damaged? Can you send a close-up photo?

Field operator

I didn’t take one. I’ll have to go back.

Pramana with Lumo

The solution

Application screenshot supplied by presenter

Planning through inspection

Lumo turns requirements into inspection checks, guides the conversation, and requests the evidence needed to complete them.

Findings connected to their evidence

Interactive models locate the parts being inspected. Findings and photos stay attached to their reports.

Review and follow-up

Work Orders give follow-up an owner and deadline. Supervisors ask Lumo questions and open cited sources.

One workflow from preparation to follow-up

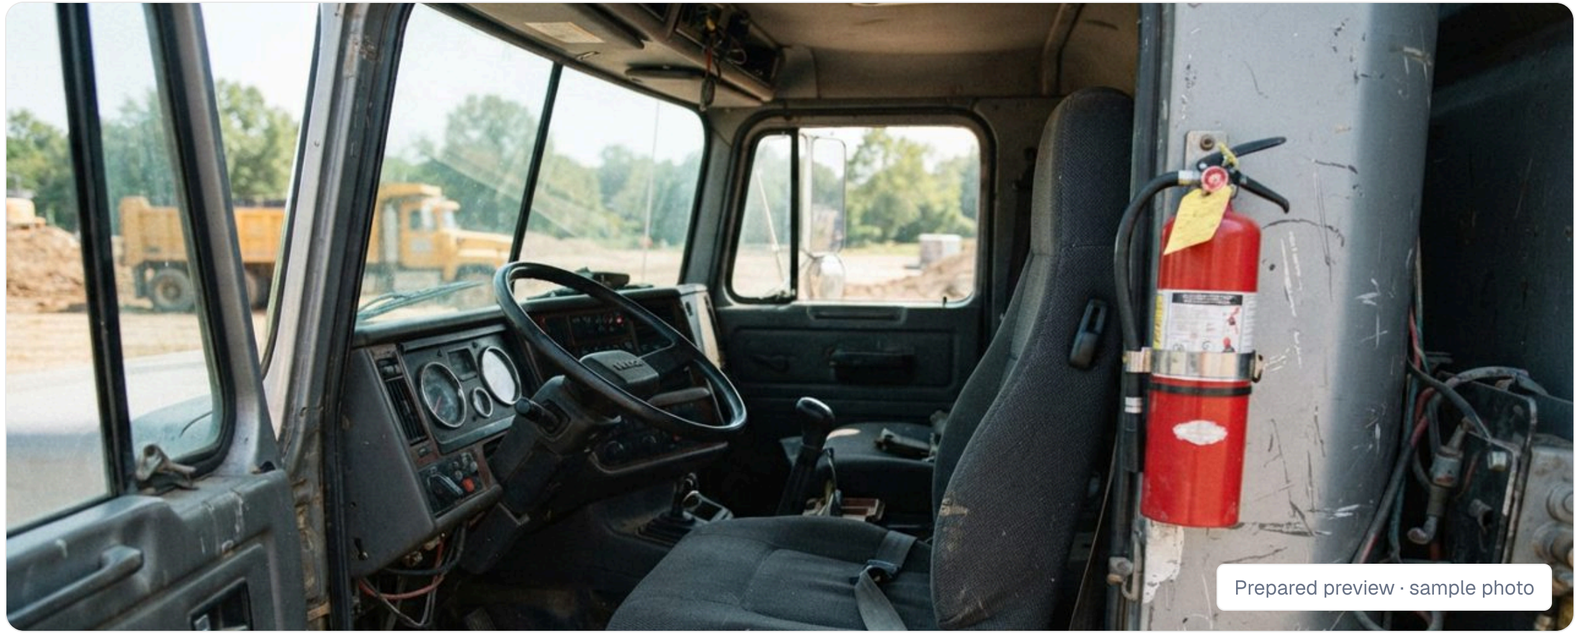

What you can do

Build inspection plans	Upload a specification sheet and refine the checks with Lumo. Locate inspection points on an interactive isometric model.
Inspect on a phone	Follow the inspection conversation, take photos or attach gallery images, and submit findings with supporting evidence.
Review results	See inspection status, urgent findings, trends, and recurring issues. Search reports, review evidence, and export PDFs.
Manage follow-up	Create Work Orders from findings, assign responsibility, set deadlines, and record completion while preserving the inspection verdict.
Ask Lumo	Ask questions across reports and Work Orders, open cited sources, and review recommendations. The read-only analyst provides a labelled data-based fallback.

Pre-operational inspection example · 90-second app demo

Demonstration

1 · Field input | 2 · Missing detail resolved | 3 · Supervisor report

Lumo

Guided evidence collection

Required detail missing

A closer photo supplies the detail.

Lumo asks the operator for a closer view so the extinguisher label can be read and attached to the inspection item.

The operator provides the required evidence while still at the vehicle.
